

# CTAGON

Copy keyfiles to a USB stick and plugin the stick to the Octagon SF918

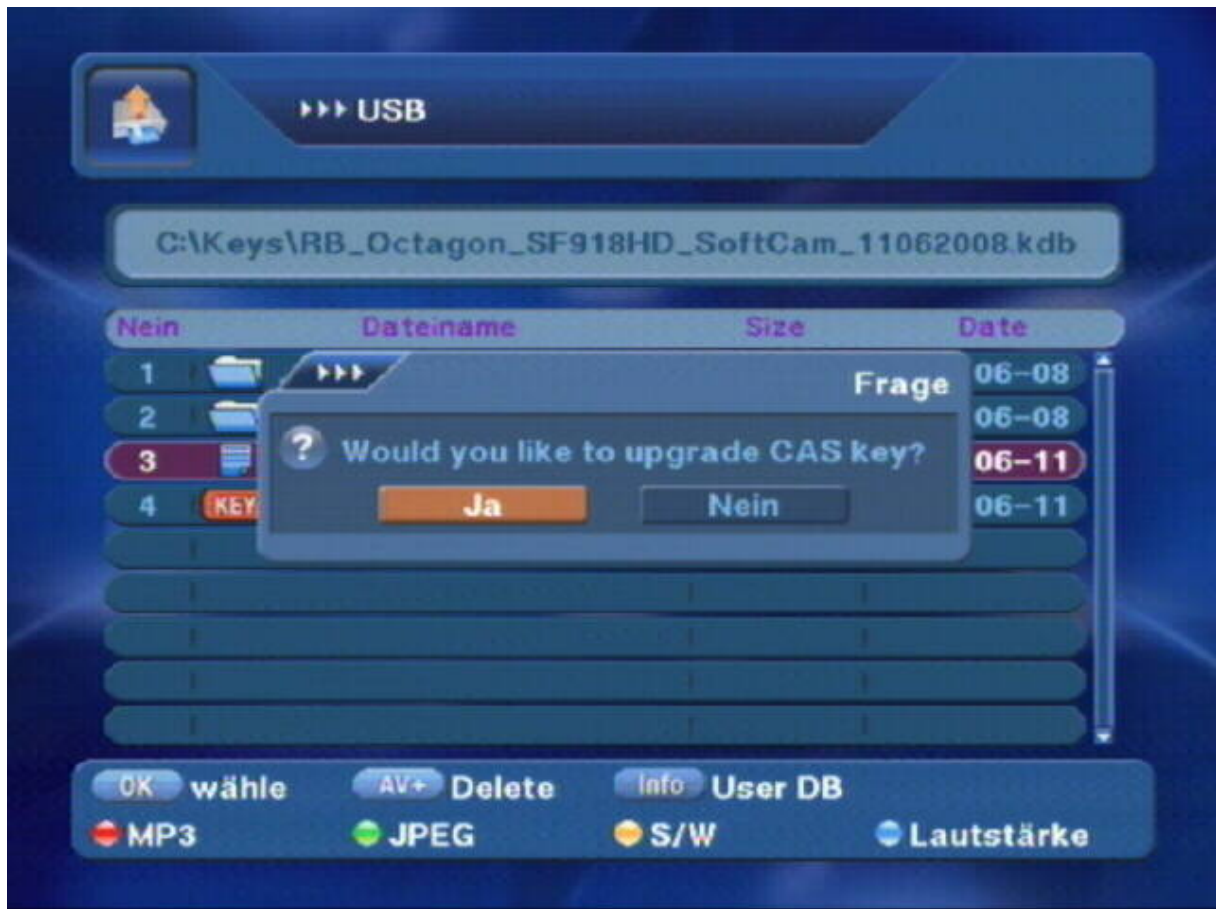

After plug in the stick the following menu appears (of course your filesystem on the stick)

By pressing the OK button and the arrow keys you can navigate through the folder

Select file and press OK.

Now, the box automatically re-started and the new Keys are raised.

For biss-keys and any CWs is an extra key-file. All other providers are in a separate Key file.

Please note:

The SoftCam Octagon files of the other models will not run on the SF918 HD properly.

have fun
